WALSPMF 1.0

WALSPMF (Weighted Alternating Least Squares-Positive Matrix Factorization) model is an extension to the more traditional PMF model and can be applied to estimate the contributions of sources to particulate matter, based on the Weighted Alternating Least Squares and Positive Matrix Factorization method.

The screenshot shows an Excel spreadsheet with a grid of cells. Column A contains a list of numbers from 1 to 28. Cell A1 contains the value 5836.855. A red box is overlaid on the right side of the spreadsheet, containing the following text:

Output information:

- F_profile: source profile
- G_matrix: normalized source contribution
- Source contribution
- Mean contribution
- Q value
- Fpeak value

The spreadsheet's status bar at the bottom shows the following tabs: Sheet1, Sheet2, Sheet3, F_profile, G_matrix, Contribution, Mean Contribution, Q_value, and Fpeak. The Q_value tab is currently selected and highlighted with a red box.
